University of Southern California

DHS University Network Summit on Research and Education  
March 16, 2007

## CREATE Resource Allocation Project

- Develop practical decision analysis tools for allocating Department of Homeland Security funds
- First case study
  - Buffer Zone Protection Plan (BZPP) funds for California
  - Conducted with the California Governor's Office of Homeland Security

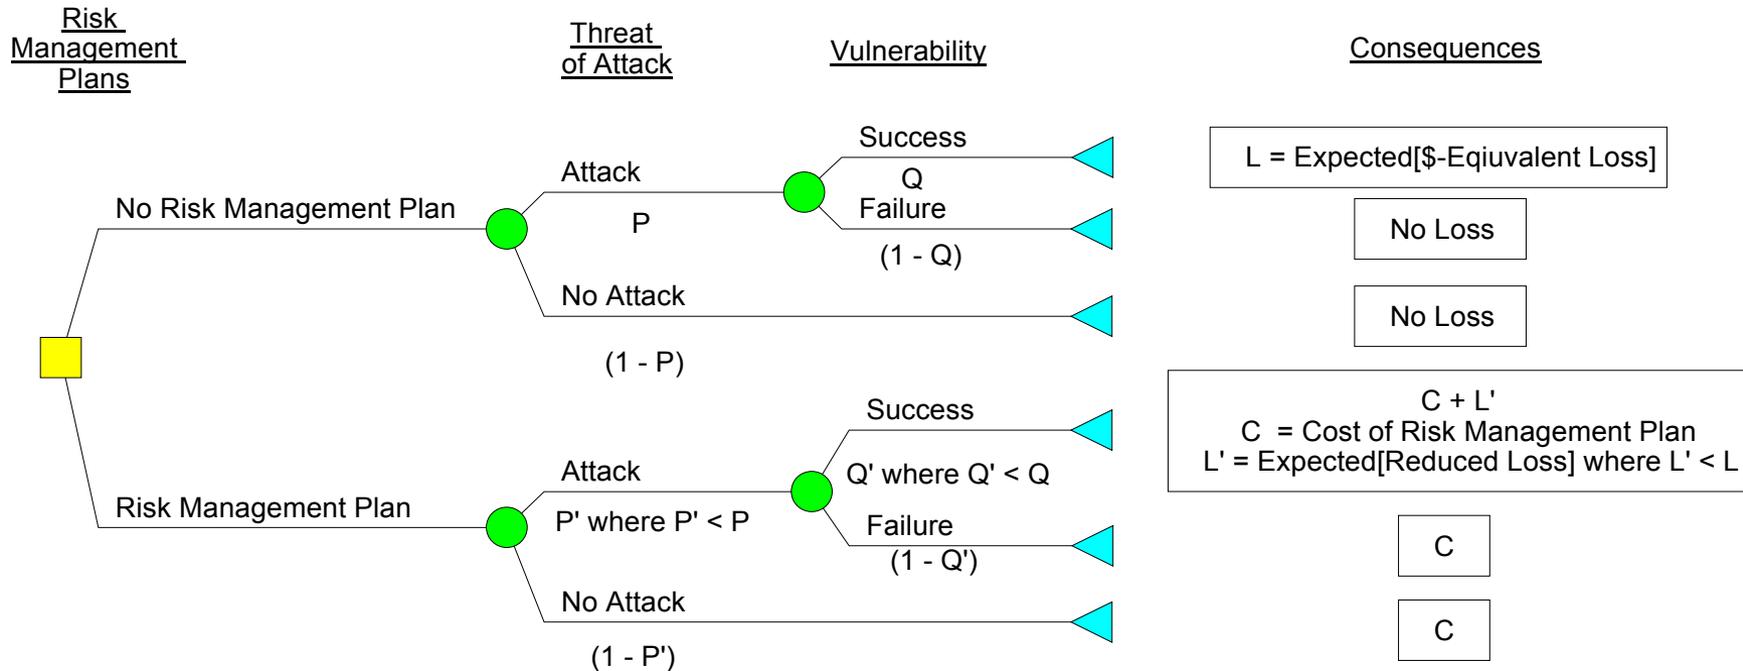

# What is the Buffer Zone Protection Program?

- The BZPP is a DHS grant program that provides funds to State and local authorities to prevent and protect against attacks against critical infrastructure and key resources
- Buffer Zone Protection Plans (BZPPs)
  - *Preventive and protective measures that make it more difficult for terrorists to conduct surveillance or launch attacks within immediate vicinity of high-risk assets*
  - BZPPs are developed in cooperation between DHS and State and local officials
  - BZPPs are intended to help increase the preparedness capabilities of local jurisdictions

# Decision Analysis Is Commonly Applied to Resource Allocation Problems

- Problem structure
  - Traditional DA: Select one of several competing alternatives
  - Resource allocation DA: Select a subset of alternatives – a portfolio - usually with a budget constraint
- Examples
  - Funding several of many research proposals (NSF)
  - Capital allocations in companies
  - Allocating resources to protect infrastructure from terrorism

# Cost-Effectiveness of Risk Management is a Simplified Framework for Plan Evaluation

## “Only” Five Inputs Required per Site

- |                    |  |
|--------------------|--|
| 1. Threat:         | Probability of Attack (P)                                      |
| 2. Vulnerability:  | Probability Attack Succeeds (Q)                                |
| 3. Consequences:   | Expected Loss if Attack Succeeds (L)<br>[\$-equivalent losses] |
| 4. Loss Reduction: | Loss Reduction with RMP ( $0 < R < 1$ )                        |
| 5. Cost:           | Cost of Risk Reduction (C)                                     |

**Expected loss:** No RMP:  $EL = P \cdot Q \cdot L$   
 With RMP:  $EL' = P \cdot Q \cdot L \cdot (1 - R) + C$

**Net loss reduction:**  $(EL - EL') = P \cdot Q \cdot L \cdot R - C$

## Optimal Resource Allocation Chooses Several Among a Set of Options

- Find associated costs,  $C_j$ , of all  $N$  competing projects,  $j=1,2,\dots,N$ .
- Evaluate the loss reduction potential for all  $N$  competing projects/alternatives such that  $E_j=(P_jQ_jL_jR_j - C_j)$ .
- Determine the subset of  $m$  projects/alternatives, such that

$$\sum_{j=1}^N E_j X_j \text{ is maximized, subject to } \sum_{j=1}^N C_j X_j \leq F$$

where  $F$  is the budget constraint and  $X_j = \{0 \text{ or } 1\}$ .

- Find optimal portfolio using:
  - Binary integer program, or
  - Heuristic solution by prioritizing on ratio of risk reduction benefit to cost:

$$\frac{(P_j \cdot Q_j \cdot L_j \cdot R_j)}{C_j}$$

## Assisting CA OHS Move Towards Risk-Based Allocation of Counterterrorism Funds

- CA OHS = California Office of Homeland Security
  - Sought assistance with allocation of funds associated with the Buffer Zone Protection Plan (BZPP)
  - Between 90 and 100 sites eligible for funding
  - Process objective: Provide significant funding to 10 to 20 sites
- Multiple meetings involving numerous people
  - Facilitated/led by team from CREATE & RAND

# Implementing Optimal Portfolio Allocation Faced Two Challenges

- Incomplete / incomparable data sets
- Assessing risk and risk reduction parameters across 100 sites
  - 5 parameters × 100 sites
- Approach:
  - Focus on consequences, qualitative considerations of threat, vulnerability and effectiveness of risk reduction
  - Combine several risk analysis approaches
    - Vulnerability analyses: HOPS, FSIVA
    - Commercial risk analyses: RMS, AIR
    - Site specific analyses: SRA
    - Additional risk analyses by CREATE and RAND
  - Identify high risk sectors by looking for “order of magnitude” differences in risk exposure

# Three Sectors Appeared to Be Higher Risk

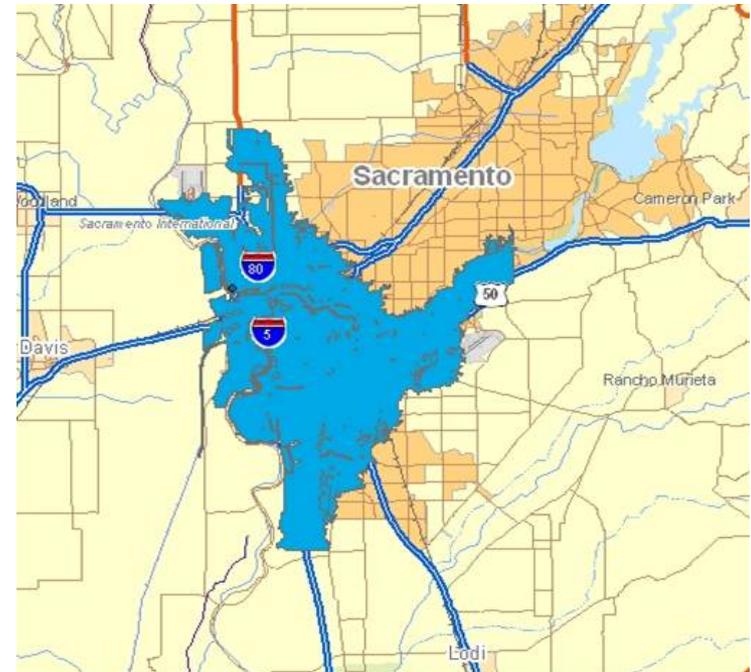

## Sector Comparisons (CREATE)

	Economic Fatality Range	Threat and Impacts	Vulnerability	Risk Reduction	Notes
<b>Chemical and Hazmat</b>	1,000-50,000	0.1b – 1.3b	Medium	Medium	High fatalities
<b>Dams</b>	100-10,000	~100b	Medium	Effective	High economics
<b>Commercial (Buildings / Tourism)</b>	100-8,000	2b – 10b	High	Medium	High threat
<b>Oil Refineries</b>	10-100	0.1b -- 0.6b	Low	Medium	Mostly economics
<b>Electrical Grid</b>	10-100	0.7b – 2.8b	Low	Medium	Mostly economics
<b>Transportation - Bridges</b>	10-100	0.01b – 0.04b	Medium	Medium	Mostly psychological
<b>Transportation - Rail</b>	100-1000	0.5b – 7.4b	High	Medium	Mostly psychological
<b>Water Treatment</b>	100-1000	0.1b – 1.3b	Low	Medium	Mostly chemicals
<b>Defense Industry Base</b>	10-100	?	Medium	Medium	DHS/DOE responsibility
<b>Postal and Shipping</b>	10-100	?	Medium	Medium	DHS responsibility
<b>Nuclear Power Plants</b>	0-100,000	12b – 40b	Medium	Medium	NRC/DHS responsibility

## Preliminary Conclusions

- Dams, chemical plants and selected commercial sites are the most risky sectors
- Each sectors deserves funding for different reasons
  - Chemical: High fatality potential
  - Dams: Fatality and economic impact potential, effective risk reduction
  - Commercial: High threat
- The main question:
  - Mix sectors or focus on one or two?
  - OHS' inclination was to pick one sector and fund all

# Consequence Analysis for Dams

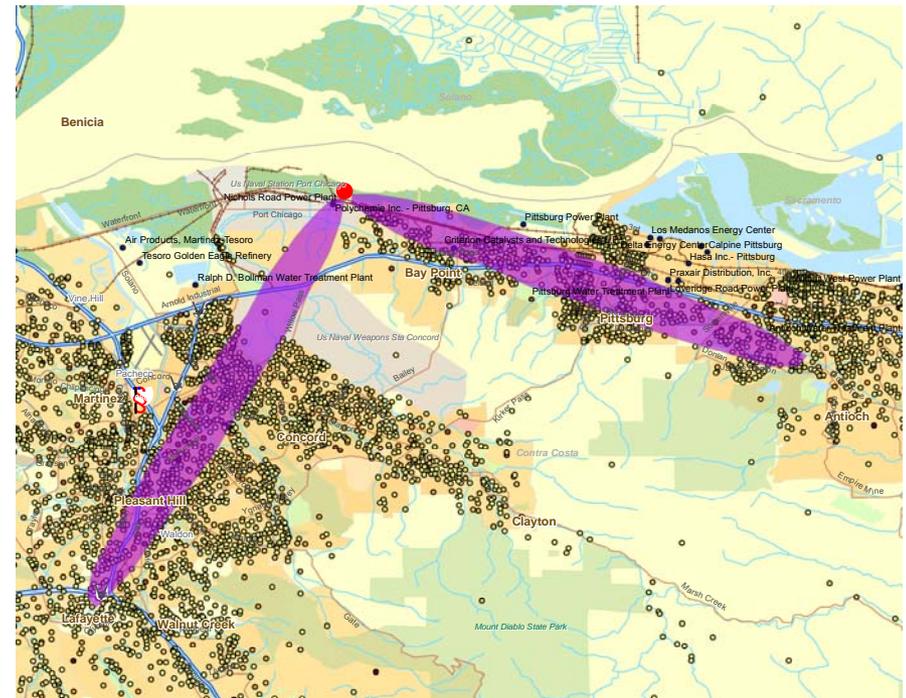

# Sector Prioritizations: Dams

Facility	Storage Capacity	Inundation Area	Population	Jobs
Dam 6	3,964,960	1872 sq-mi	175,000	48,743
Dam 1	3,540,000	1341 sq-mi	138,055	52,125
Dam 2	2,420,000	1161 sq-mi	570,055	210,442
Dam 8	2,030,000			
Dam 3	1,961,320	925 sq-mi	370,582	136,799
Dam 9	1,030,000			
Dam 10	969,600			
Dam 4	894,000	188 sq-mi	448,000	110,132
Dam 12	651,000	Arizona	low	low
Dam 7	221,600	Catastrophic fatalities		
Dam 14	170,000			
Dam 5	41,110	Catastrophic fatalities		
Dam 13	28,640			
Dam 11	20,790	Mission critical

## Impact on CA OHS:

- CA OHS found the analysis useful
  - They recognized that although the analysis was incomplete, it was also a quantum leap ahead of the previous year's process
  - Involvement of credible outside analysts lent credibility to the entire process and improved acceptance of decisions
  - Sector-based screening and within-sector analysis can reduce the information requirements considerably
- Identified critical needs for future analyses:
  - Quantitative assessments of relative threat are potentially very useful
  - **ASSESSING RISK IS NECESSARY BUT NOT SUFFICIENT!**
    - Risk-based allocation is about risk management as much as risk assessment
    - Require standardized vulnerability analyses and risk management plans for EVERY site
    - It is difficult (if not impossible) to assess cost-effectiveness if you don't know how funds will be used

## Future Work

- Further case analyses:
  - Assist CA OHS on 2007 BZPP prioritization
  - Identify other case analysis opportunities
    - Allocating funds to protect against bioterrorism
    - Allocating funds across threat areas (bio, chem, nuclear, infrastructure, etc.)
- Understanding challenges involved when analyzing LARGE numbers of sites, threats, and risk management alternatives
  - Risk management plans often incomplete or incomparable—makes it hard to evaluate cost-effectiveness!
  - Information required for risk assessment hard to get, hard to use, hard to analyze
  - Explore utility of robust resource allocation strategies
